

Joint Simulation: Strategy Consensus & Calibration Contagion in One System

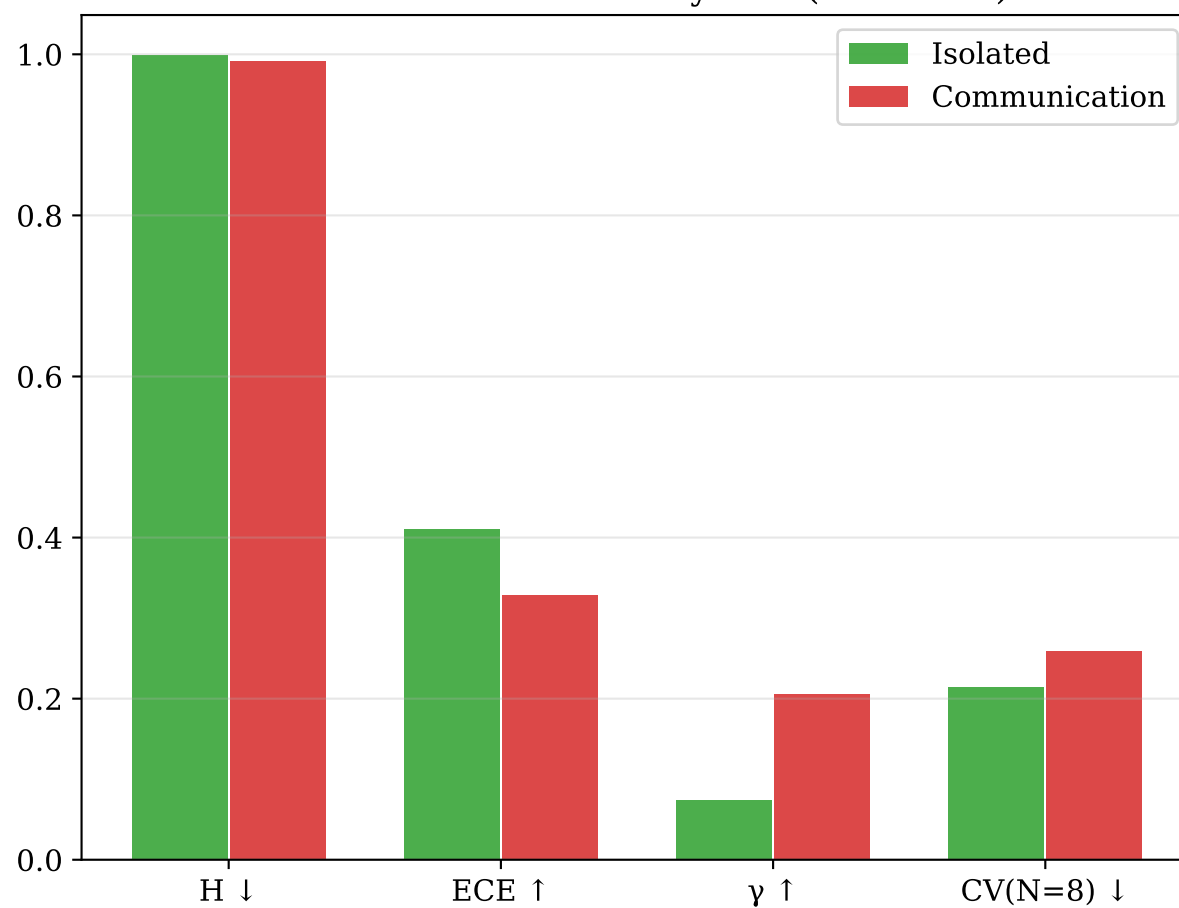

A. Face 1: Strategy Consensus
(Communication $\rightarrow$ H decreases)

B. Face 2: Calibration Contagion
(Isolated self-calibrates; Communication blocks it)

C. Both Effects in One System (200 seeds)

Joint Simulation Results

Face 1 – Strategy Consensus:

Communication reduces H: 0.9910 vs 0.9988

Communication increases γ : 0.2056 vs 0.0739

Face 2 – Calibration Contagion:

Isolated self-calibrates: ECE $\rightarrow$ 0.4103

Communication blocks it: ECE $\rightarrow$ 0.3290

Key: Both effects emerge from the SAME simulation with the SAME agents, tasks, and communication protocol. This demonstrates that the two faces are not independent phenomena requiring separate experiments – they co-occur in any multi-agent TTRL system with communication.
